THOR

THOR is a portable scanner that detects hack tools, backdoors and traces of hacker activity on end points.

While everyday Anti-virus scanners recognize malware such as viruses, trojans and exploit codes, THOR uses more than 9000 special YARA signatures and a series of more than 24 different checks to examine systems for typical attacker tools, activities in logs, system manipulations, and other elements that can expose attacker activities.

Security analysts, forensic experts and security monitoring specialists at Nextron Systems regularly update THOR with information from various sources on attack patterns and hack tools. These sources include:

- Threat Intel Reports and Threat Feeds
- Ongoing monitoring of attackers tool sets
 (e.g. disclosed tools, hack tools from underground forums)
- Forensic analyses of compromised systems in customer APTs

THOR can be easily extended to handle individual, client-specific attack patterns (e.g. the detection of specific malware files or certain log entries on the basis of a forensic analysis).

THOR generates different output types: text log, HTML report and SYSLOG. The well-known CEF format used by ArcSight and JSON are also supported. Therefore it is an easy task to integrate THOR's logs into any major SIEM system.

THOR can operate completely offline. The scope of application is therefore very flexible. You can easily scan separated network segments like DMZs, collect and merge the log data afterwards.

Focus on APTs

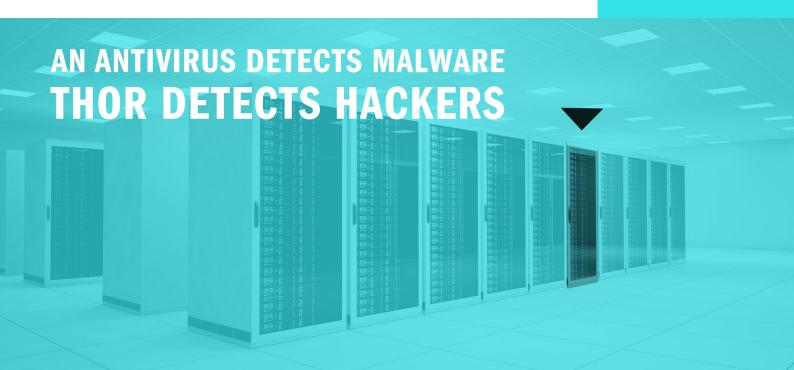

Signatures maintained by security analysts

Specific indicator and signature sources

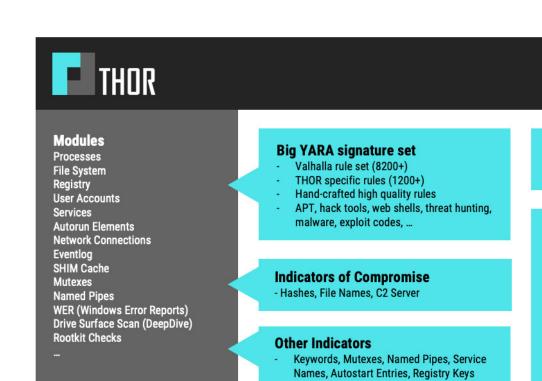

Custom case-related attack patterns

Multiple output formats

High flexibility due to offline scan

<u>THOR</u>

Anonymized Indicators from Customer APT Cases

Public Sources

- Threat group research
- APT reports

Unwanted Software

- Public dual use or hack tools
- Web shells / unprotected admin web applications
- Underground forum monitoring
- Virustotal monitoring and research

SYSLOG

HTML

TXT

There are three major use cases for THOR:

Triage Sweep

Scan run on all systems in a system einvironment, reporting to a central SIEM or ASGARD Analysis Cockpit to identify compromised systems

Single System Live Forensics Scan run on a single running system

Scan run on a single running system reported as suspicious to falsify or verify a possible threat

Image Scan im Lab

Scan run on a mounted drive image in the Lab to identify known indicators of compromise and speed up forensic analysis

Further advantages / features are:

- Central scan control via ASGARD appliance
- Quarantine samples via network (Bifrost)
- Disk surface scan to detect already deleted elements (DeepDive)
- Sigma rule scanning (local logs and Eventlog)
- MITRE ATT&CK tagging of matches
- Resource control feature provides high stability and ensures low CPU load during the scan
- Encrypted signatures / reports
- Data protection option to remove personal information from the scan results
- Quick scan mode for fast analysis of the most important elements within minutes
